## Problem statement:

### Student Record Management Using Singly Linked List

A singly linked list is a dynamic data structure in which each node contains data and a pointer to the next node. In this project, a linked list is used to store student records such as Roll Number, Name, and Marks.

The program performs four main operations:

Insertion – Add a new student record.

Deletion – Delete a student record using roll number.

Searching – Search for a student using roll number.

Display – Display all student records.

This project demonstrates the practical use of linked lists in Student Record Management.
